REGENERATION

LONGER LIFE THROUGH INNOVATIVE RENEWAL

Quick filter replacement with minimal production downtime and sustainable service

Herding filter media are characterized by their exceptional durability. Our unique regeneration process significantly extends the service life and helps to conserve valuable resources.

The Herding Regeneration Concept ensures fast and efficient filter element replacement, allowing production to continue with virtually no interruption. Regenerated replacement elements are ready for immediate use after installation. Depending on the Water Hazard Class (WHC), removed filter elements must be cleaned either by the customer before return or, upon request, by Herding (only for WHC 1). Herding provides precise instructions for the required pre-cleaning. Returned filter elements must be sent back within 15 days. Regenerated filters are automatically supplied with a Product Carbon Footprint (PCF) self-declaration, documenting their sustainable contribution to resource conservation.

HERDING® REGENERATION PROCESS

*Final quality control: Check differential pressure and coating quality, measure surface and leakage resistance for antistatic design.

2-YEAR WARRANTY

Regenerated filter elements from Herding have almost the same properties as new filter elements. Two-year warranty – mechanical strength only if customer-installed; full coverage when installed by Herding technicians.
